## YAHOO! Research

## Mech Design for Prediction

- Q: Will there be a bird flu outbreak in the UK in 2007?
- A: Uncertain. Evidence distributed: health experts, nurses, public
- Goal: Obtain a forecast as good as omniscient center with access to all evidence from all sources

## YAHOO! Research

## Mech Design for Prediction

## YAHOO! Research

## A Prediction Market

- Take a random variable, e.g. Bird Flu Outbreak UK 2007?
(Y/N)
- Turn it into a financial instrument payoff = realized value of variable

I am entitled to:
\$1 if
Bird Flu UK '07
\$0 if
Bird Flu UK '07
http://tradesports.com

## YAHOO! Research

## Bidding Languages

- Traders want to bet on properties of orderings, not explicitly on orderings: more natural, more feasible
- A will win ; A will "show"
- A will finish in [4-7] ; \{A,C,E\} will finish in top 10
- A will beat $B$; $\{A, D\}$ will both beat $\{B, C\}$
- Buy 6 units of "\$1 if $A>B$ " at price $\$ 0.4$
- Supported to a limited extent at racetrack today, but each in different betting pools
- Want centralized auctioneer to improve liquidity \& information aggregation

## YAHOO! Research

## Auctioneer Problem

- Auctioneer's goal:

Accept orders with non-zero worstcase loss (auctioneer never loses money)

The Matching Problem

- Formulated as LP

## YAHOO! Research

## Example

- A three-way match
- Buy 1 of " $\$ 1$ if $A>B$ " for 0.7
- Buy 1 of " $\$ 1$ if $\mathrm{B}>C$ " for 0.7
- Buy 1 of " $\$ 1$ if $\mathrm{C}>\mathrm{A}$ " for 0.7

## YAHOO! Research

## Pair Betting

- All bets are of the form "A will beat B"
- Cycle with sum of prices > k-1 ==> Match (Find best cycle: Polytime)
- Match =/=> Cycle with sum of prices > k-1
- Theorem: The Matching Problem for Pair Betting is NP-hard (reduce from min feedback arc set)

## YAHOO! Research

## Subset Betting

- All bets are of the form
- "A will finish in positions 3-7", or
- "A will finish in positions 1,3 , or 10 ", or
- "A, D, or F will finish in position 2"
- Theorem: The Matching Problem for Subset Betting is polytime (LP + maximum matching separation oracle)

## YAHOO! Research

## Market Combinatorics

Boolean

| I am entitled to: $\$ 1$ if $\mathrm{A} 1 \& \mathrm{~A} 2 \& \ldots \& \mathrm{An}$ | I am entitled to: $\$ 1$ if $\mathrm{A} 1 \& \mathrm{~A} 2 \& \ldots \& \overline{\mathrm{An}}$ |
| :---: | :---: | :---: |
| I am entitled to: $\$ 1$ if $\overline{\mathrm{A} 1 \& A 2 \& \ldots \& A n}$ | I am entitled to: $\$ 1$ if $\overline{\mathrm{A} 1 \& A 2 \& \ldots \& \overline{\mathrm{An}}}$ |
| I am entitled to: $\$ 1$ if $\mathrm{A} 1 \& \overline{\mathrm{~A} 2 \&} \ldots . . . \& \mathrm{An}$ | I am entitled to: $\$ 1$ if $\mathrm{A} 1 \& \overline{\mathrm{~A} 2 \& \ldots \& \overline{\mathrm{An}}}$ |

I am entitled to: $\$ 1$ if $\overline{\mathrm{A} 1} \& \overline{\mathrm{~A} 2} \& \ldots \& \mathrm{An}$
I am entitled to:
$\$ 1$ if $\overline{\mathrm{A} 1} \& \overline{\mathrm{~A} 2} \& \ldots \& \overline{\mathrm{An}}$

- Betting on complete conjunctions is both unnatural and infeasible

## YAHOO! Research

## Market Combinatorics

## Boolean

- A bidding language: write your own security

> I am entitled to: \$1 if Boolean_fn | Boolean_fn

- For example

| I am entitled to: $\$ 1$ if $A 1 \mid \overline{\mathrm{A} 2}$ | I am entitled to: \$1 if $A$ |
| :--- | :--- | :--- |
| I am entitled to: $\$ 1$ if $(\mathrm{A} 1 \& \overline{\mathrm{~A} 7}) \\| \mathrm{A} 13 \mid(\mathrm{A} 2 \\| \overline{\mathrm{A} 5}) \& A 9$ |  |

- Offer to buy/sell q units of it at price p
- Let everyone else do the same
- Auctioneer must decide who trades with whom at what price... How? (next)
- More concise/expressive; more natural

## YAHOO! Research

## The Matching Problem

- There are many possible matching rules for the auctioneer
- A natural one: maximize trade subject to no-risk constraint
- Example:
- buy 1 of
- sell 1 of
- sell 1 of

| $\$ 1$ if A1 | for $\$ 0.40$ |
| :--- | :--- |
| $\$ 1$ if A1\&A2 | for $\mathbf{\$ 0 . 1 0}$ |
| $\$ 1$ if A1\&A2 | for $\$ 0.20$ |

- No matter what happens, auctioneer cannot lose trader gets $\$ \$$ in state:

| A 1 A 2 | $\mathrm{~A} 1 \overline{\mathrm{~A} 2}$ | $\overline{\mathrm{~A} 1 \mathrm{~A} 2}$ | $\overline{\mathrm{~A} 1 \mathrm{~A} 2}$ |
| ---: | ---: | ---: | ---: |
| 0.60 | 0.60 | -0.40 | -0.40 |
| -0.90 | 0.10 | 0.10 | 0.10 |
| 0.20 | -0.80 | 0.20 | 0.20 |
| -0.10 | -0.10 | -0.10 | -0.10 | money

Predicted Probabilities of Senate Elections based on Market Data from Tradesports.com

Expected Republican 50.78 Democrat 47.25 Others 1.98
Leaning Democrat 49 Republican 49 Others 2

GOP Senate Control $69.0 \%$
GOP House Control $20.0 \%$

## YAHOO! Research

Fortnow; Kilian; Pennock; Wellman

## Complexity Results

- Divisible orders: will accept any q* $\mathbf{q}^{\text {q }}$
- Indivisible: will accept all or nothing

- Natural algorithms
- divisible: linear programming
- indivisible: integer programming;
logical reduction?

## YAHOO! Research

## Automated Market Makers

- A market maker (a.k.a. bookmaker) is a firm or person who is almost always willing to accept both buy and sell orders at some prices
- Why an institutional market maker? Liquidity!
- Without market makers, the more expressive the betting mechanism is the less liquid the market is (few exact matches)
- Illiquidity discourages trading: Chicken and egg
- Subsidizes information gathering and aggregation:

Circumvents no-trade theorems

- Market makers, unlike auctioneers, bear risk. Thus, we desire mechanisms that can bound the loss of market makers
- Market scoring rules [Hanson 2002, 2003, 2006]
- Dynamic pari-mutuel market [Pennock 2004]

## YAHOO! Research

## Automated Market Makers

- $n$ disjoint and exhaustive outcomes
- Market maker maintain vector $Q$ of outstanding shares
- Market maker maintains a cost function $C(Q)$ recording total amount spent by traders
- To buy $\Delta Q$ shares trader pays $C(Q+\Delta Q)-C(Q)$ to the market maker; Negative "payment" = receive money
- Instantaneous price functions are

$$
p_{i}(Q)=\frac{\partial C(Q)}{\partial q_{i}}
$$

- At the beginning of the market, the market maker sets the initial $Q^{0}$, hence subsidizes the market with $C\left(Q^{0}\right)$.
- At the end of the market, $C\left(Q^{f}\right)$ is the total money collected in the market. It is the maximum amount that the MM will pay out.

## YAHOO! Research

## Hanson's Market Maker I

Logarithmic Market Scoring Rule

- $n$ mutually exclusive outcomes
- Shares pay \$1 if and only if outcome occurs
- Cost Function

$$
C(Q)=b \times \log \left(\sum_{i=1}^{n} e^{\frac{q_{i}}{b}}\right)
$$

- Price Function

$$
p_{i}(Q)=\frac{e^{\frac{q_{i}}{b}}}{\sum_{j=1}^{n} e^{\frac{q_{j}}{b}}}
$$

## YAHOO! Research

## Hanson's Market Maker II

Quadratic Market Scoring Rule

- We can also choose different cost and price functions
- Cost Function

$$
C(Q)=\frac{\sum_{i=1}^{n} q_{i}}{n}+\frac{\sum_{i=1}^{n} q_{i}^{2}}{4 b}+\frac{\left(\sum_{i=1}^{n} q_{i}\right)^{2}}{4 b}-\frac{b}{n}
$$

- Price Function

$$
p_{i}(Q)=\frac{1}{n}+\frac{q_{i}}{2 b}-\frac{\sum_{j=1}^{n} q_{j}}{2 n b}
$$

## YAHOO! Research

## Log Market Scoring Rule

- Market maker's loss is bounded by $b^{*} \ln (n)$
- Higher $b \Rightarrow$ more risk, more "liquidity"
- Level of liquidity (b) never changes as wagers are made
- Could charge transaction fee, put back into b (Todd Proebsting)
- Much more to MSR: sequential shared scoring rule, combinatorial MM "for free",
... see Hanson 2002, 2003, 2006

## Computational Issues

- Straightforward approach requires exponential space for prices, holdings, portfolios
- Could represent probabilities using a Bayes net or other compact representation; changes must keep distribution in the same representational class
- Could use multiple overlapping patrons, each with bounded loss. Limited arbitrage could be obtained by smart traders exploiting inconsistencies between patrons

## YАНОО! Research

## Pari-Mutuel Market

Basic idea

## YAHOO! Research

## Dynamic Parimutuel Market

## YAHOO! Research

## Share-ratio price function

- One can view DPM as a market maker
- Cost Function:

$$
C(Q)=\sqrt{\sum_{i=1}^{n} q_{i}^{2}}
$$

- Price Function:
- Properties

$$
p_{i}(Q)=\frac{q_{i}}{\sqrt{\sum_{j=1}^{n} q_{j}^{2}}}
$$

- No arbitrage
- price $/{ }_{i}$ price $_{j}=q_{i} / q_{j}$
- price ${ }_{i}$ < \$1
- payoff if right $=\mathbf{C}\left(\mathrm{Q}_{\text {final }}\right) / \mathbf{q}_{\mathrm{o}}>\boldsymbol{\$ 1}$

## YAHOO! Research

Open Questions
Combinatorial Betting

- Usual hunt: Are there natural, useful, expressive bidding languages (for permutations, Boolean, other) that admit polynomial time matching?
- Are there good heuristic matching algorithms (think WalkSAT for matching); logical reduction?
- How can we divide the surplus?
- What is the complexity of incremental matching?

## YAHOO! Research

Open Questions
Automated Market Makers

- For every bidding language with polytime matching, does there exist a polytime MSR market maker?
- The automated MM algorithms are online algorithms: Are there other online MM algorithms that trade more for same loss bound?
